

AI in Education, GPA and Mental Health Effects

Proposed By: *Matthew Hess*

GitHub Repository: https://github.com/mjhess01/AI_in_Education

Project Overview

The ways that AI shapes our world for the better are always at the forefront of the conversation, but what we don't discuss is how it actually impacts the way our brains develop. Our college years are effectively the time for us to learn how to learn. How to research and use the information we find are a big part of what students do. Does AI take away from that process, or does it aid in it?

Data Sources

Impact of Ai on Students

Source: Nagi Sisiro

Fields: Pre Semester GPA, Post Semester GPA, Skill Retention Score, Burnout Risk Level, Anxiety Level During Exams, Perceived AI Dependency

Link: <https://www.kaggle.com/datasets/laveshjadon/ai-impact-on-students>

How AI is Changing Life | AI and Student Life 2026

Source: Sohaib Malik

Fields: Primary AI Tool, Time Saved Hours Weekly, AI Ethics Concern, Career Confidence Score

Link: <https://www.kaggle.com/datasets/sohaibdevw/ai-and-student-life-2026-the-new-normal>

Research Objectives

Primary Question(s): Does AI actually help students or hinder them?

Secondary/Exploratory Questions: How does AI affect GPA? How does AI affect mental health?

Data Preparation Approach

- Align datasets on GPA start and endpoints as well as use-cases.
- Determine if the outliers or extreme values are important or not through exploration
- New Variables/Indices:
 - GPA difference (Ending GPA – Starting GPA)
- Tables:
 - Students (student ID, major, age, academic year, GPA)
 - AI Usage (student ID, paid subscription, primary AI tool, main use case)
 - Outcome (student ID, GPA baseline, GPA post AI)

Current Status

Summarize what you have already completed. Examples:

- Acquired datasets June 2026 and inspected at the same time
- Rounding GPA to second decimal to match both datasets, reword the usage cases to match both datasets in name with meaning
- Created schema draft

Deliverables (Remaining Work)

Required Tasks (must be completed):

- Finish cleaning literacy dataset
- Implement 3 Python functions
- Build SQLite schema and load tables
- Produce 3 required visualizations
- Write README and data dictionary

Project Timeline

Phase 1: Clean data, set up database. Explore the shape and types of data

Phase 2: Make drafts of visuals with CSVs. Refine them.

Phase 3: Use tables for visuals, explore more areas.

Phase 4: Finalize deliverables, polish repo.

Additional Considerations

Obviously these are different students, so the IDs will not match up. The majors cover different areas, one more broad and the other more specific; if possible will make the specific ones match broad without taking away from their meaning. Might look for more AI specific datasets that cover usage outside of education.
